

Electrical safety — working around power lines

Working around power lines requires careful planning and can involve obtaining municipal permits and approvals, consulting with utility companies to accurately determine the voltage, and submitting a completed [30M33 form](#) to WorkSafeBC.

Pre-job planning

Everyone who works near overhead power lines needs to know and follow the applicable safety practices. Before any cranes arrive at the worksite, employers must implement control measures that include:

- A clear pre-job plan.
- Training in the use of safety equipment.
- Training of all workers who will be working near power lines.

Additional elements included in pre-job planning:

- Site plans must show the location of existing or planned power lines.
- The prime contractor, site supervisor, or appointed person must call the utility company to de-energize or insulate power lines before anyone works around them.
- Mark the danger zone on the ground as a visual aid for operators and spotters.
- It's essential to maintain a safe working distance from power lines, as shown in the following table.

Voltage Phase to phase	Metres	Feet
Over 750 V to 75 kV	3	10
Over 75 kV to 250 kV	4.5	15
Over 250 to 550 kV	6	20

Safe practices for riggers and operators when working near overhead power lines

- Use an insulated or non-conductive tagline.
- Avoid stacking materials near or under overhead lines.
- Reduce the working speed of the lifting equipment.
- Be aware if the power line is moving (e.g., due to wind).
- Use a dedicated spotter to assist in the lifting operation around a power line. The spotter must warn operators when any part of their equipment or load approaches the minimum distances set out by law.
- Create a safe route for the machine to follow if it is required to pass under an overhead power line.

If contact between a crane and a line occurs

- Do not try to break contact with the line. Stay inside the cab until a utility representative tells you it is safe.
- If you must exit the cab due to fire or some other hazard, jump clear from the equipment. Land on both feet at the same time, and keep them together.
- Once on the ground, if you must move, shuffle your feet heel to toe, keeping your feet in contact with one another.
